nag_dggsvp3 (f08vgc)

1 Purpose

nag_dggsvp3 (f08vgc) uses orthogonal transformations to simultaneously reduce the m by n matrix A and the p by n matrix B to upper triangular form. This factorization is usually used as a preprocessing step for computing the generalized singular value decomposition (GSVD). For sufficiently large problems, a blocked algorithm is used to make best use of level 3 BLAS.

2 Specification

```
#include <nag.h>
#include <nagf08.h>

                 Nag_ComputeVType jobv, Nag_ComputeQType jobq, Integer m, Integer p,
                 Integer n, double a[], Integer pda, double b[], Integer pdb,
                 double tola, double tolb, Integer *k, Integer *l, double u[],
                 Integer pdu, double v[], Integer pdv, double q[], Integer pdq,

3 Description

nag_dggsvp3 (f08vgc) computes orthogonal matrices U , V and Q such that

$$U^T A Q = \begin{cases} \begin{matrix} & \begin{matrix} n-k-l & k & l \end{matrix} \\ & k \begin{pmatrix} 0 & A_{12} & A_{13} \\ 0 & 0 & A_{23} \\ 0 & 0 & 0 \end{pmatrix} \\ m-k-l \end{matrix}, & \text{if } m-k-l \geq 0; \\ \begin{matrix} & \begin{matrix} n-k-l & k & l \end{matrix} \\ & k \begin{pmatrix} 0 & A_{12} & A_{13} \\ 0 & 0 & A_{23} \end{pmatrix} \\ m-k \end{matrix}, & \text{if } m-k-l < 0; \end{cases}$$

$$V^T B Q = \begin{matrix} & \begin{matrix} n-k-l & k & l \end{matrix} \\ l \begin{pmatrix} 0 & 0 & B_{13} \\ 0 & 0 & 0 \end{pmatrix} \\ p-l \end{matrix}$$

where the k by k matrix A_{12} and l by l matrix B_{13} are nonsingular upper triangular; A_{23} is l by l upper triangular if $m-k-l \geq 0$ and is $(m-k)$ by l upper trapezoidal otherwise. $(k+l)$ is the effective numerical rank of the $(m+p)$ by n matrix $(A^T \ B^T)^T$.

This decomposition is usually used as the preprocessing step for computing the Generalized Singular Value Decomposition (GSVD), see function nag_dtgsja (f08yec); the two steps are combined in nag_dggsvd3 (f08vcc).

7 Accuracy

$$\|E\|_2 = O(\epsilon)\|A\|_2 \quad \text{and} \quad \|F\|_2 = O(\epsilon)\|B\|_2,$$

and ϵ is the *machine precision*.

8 Parallelism and Performance

nag_dggsvp3 (f08vgc) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

nag_dggsvp3 (f08vgc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the x06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

9 Further Comments

This function replaces the deprecated function nag_dggsvp (f08vec) which used an unblocked algorithm and therefore did not make best use of level 3 BLAS functions.

The complex analogue of this function is nag_zggsvp3 (f08vuc).

10 Example

This example finds the generalized factorization

$$A = U\Sigma_1 \begin{pmatrix} 0 & S \end{pmatrix} Q^T, \quad B = V\Sigma_2 \begin{pmatrix} 0 & T \end{pmatrix} Q^T,$$

of the matrix pair $\begin{pmatrix} A & B \end{pmatrix}$, where

$$A = \begin{pmatrix} 1 & 2 & 3 \\ 3 & 2 & 1 \\ 4 & 5 & 6 \\ 7 & 8 & 8 \end{pmatrix} \quad \text{and} \quad B = \begin{pmatrix} -2 & -3 & 3 \\ 4 & 6 & 5 \end{pmatrix}.$$
