

NAG Library Function Document

nag_ztbmv (f16sgc)

1 Purpose

nag_ztbmv (f16sgc) performs matrix-vector multiplication for a complex triangular band matrix.

2 Specification

```
#include <nag.h>
#include <nagf16.h>

void nag_ztbmv (Nag_OrderType order, Nag_UptoType uplo, Nag_TransType trans,
    Nag_DiagType diag, Integer n, Integer k, Complex alpha,
    const Complex ab[], Integer pdab, Complex x[], Integer incx,
    NagError *fail)
```

3 Description

nag_ztbmv (f16sgc) performs one of the matrix-vector operations

$$x \leftarrow \alpha Ax, \quad x \leftarrow \alpha A^T x \quad \text{or} \quad x \leftarrow \alpha A^H x,$$

where A is an n by n complex triangular band matrix with k subdiagonals or superdiagonals, x is an n -element complex vector and α is a complex scalar.

5 Arguments

1: **order** – Nag_OrderType *Input*

On entry: the **order** argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = Nag_RowMajor. See Section 2.3.1.3 in How to Use the NAG Library and its Documentation for a more detailed explanation of the use of this argument.

Constraint: **order** = Nag_RowMajor or Nag_ColMajor.

2: **uplo** – Nag_UptoType *Input*

On entry: specifies whether A is upper or lower triangular.

uplo = Nag_Upper
 A is upper triangular.

uplo = Nag_Lower
 A is lower triangular.

Constraint: **uplo** = Nag_Upper or Nag_Lower.

3:	trans – Nag_TransType	<i>Input</i>
<i>On entry:</i> specifies the operation to be performed.		
	trans = Nag_NoTrans	
	$x \leftarrow \alpha Ax.$	
	trans = Nag_Trans	
	$x \leftarrow \alpha A^T x.$	
	trans = Nag_ConjTrans	
	$x \leftarrow \alpha A^H x.$	
<i>Constraint:</i> trans = Nag_NoTrans, Nag_Trans or Nag_ConjTrans.		
4:	diag – Nag_DiagType	<i>Input</i>
<i>On entry:</i> specifies whether A has nonunit or unit diagonal elements.		
	diag = Nag_NonUnitDiag	
	The diagonal elements are stored explicitly.	
	diag = Nag_UnitDiag	
	The diagonal elements are assumed to be 1 and are not referenced.	
<i>Constraint:</i> diag = Nag_NonUnitDiag or Nag_UnitDiag.		
5:	n – Integer	<i>Input</i>
<i>On entry:</i> n , the order of the matrix A .		
<i>Constraint:</i> n ≥ 0 .		
6:	k – Integer	<i>Input</i>
<i>On entry:</i> k , the number of subdiagonals or superdiagonals of the matrix A .		
<i>Constraint:</i> k ≥ 0 .		
7:	alpha – Complex	<i>Input</i>
<i>On entry:</i> the scalar α .		
8:	ab [<i>dim</i>] – const Complex	<i>Input</i>
Note: the dimension, <i>dim</i> , of the array ab must be at least $\max(1, \mathbf{pdab} \times \mathbf{n})$.		
<i>On entry:</i> the n by n triangular band matrix A .		
This is stored as a notional two-dimensional array with row elements or column elements stored contiguously. The storage of elements of A_{ij} , depends on the order and uplo arguments as follows:		
if order = Nag_ColMajor and uplo = Nag_Upper, A_{ij} is stored in ab [$k + i - j + (j - 1) \times \mathbf{pdab}$], for $j = 1, \dots, n$ and $i = \max(1, j - k), \dots, j$;		
if order = Nag_ColMajor and uplo = Nag_Lower, A_{ij} is stored in ab [$i - j + (j - 1) \times \mathbf{pdab}$], for $j = 1, \dots, n$ and $i = j, \dots, \min(n, j + k)$;		
if order = Nag_RowMajor and uplo = Nag_Upper, A_{ij} is stored in ab [$j - i + (i - 1) \times \mathbf{pdab}$], for $i = 1, \dots, n$ and $j = i, \dots, \min(n, i + k)$;		
if order = Nag_RowMajor and uplo = Nag_Lower, A_{ij} is stored in ab [$k + j - i + (i - 1) \times \mathbf{pdab}$], for $i = 1, \dots, n$ and $j = \max(1, i - k), \dots, i$.		

If **diag** = Nag_UnitDiag, the diagonal elements of AB are assumed to be 1, and are not referenced.

9: **pdab** – Integer *Input*

On entry: the stride separating row or column elements (depending on the value of **order**) of the matrix A in the array **ab**.

Constraint: **pdab** $\geq k + 1$.

10: **x[dim]** – Complex *Input/Output*

Note: the dimension, *dim*, of the array **x** must be at least $\max(1, 1 + (n - 1)|\text{incx}|)$.

On entry: the right-hand side vector *b*.

On exit: the solution vector *x*.

11: **incx** – Integer *Input*

On entry: the increment in the subscripts of **x** between successive elements of *x*.

Constraint: **incx** $\neq 0$.

12: **fail** – NagError * *Input/Output*

The NAG error argument (see Section 2.7 in How to Use the NAG Library and its Documentation).

6 Error Indicators and Warnings

NE_ALLOC_FAIL

Dynamic memory allocation failed.

See Section 2.3.1.2 in How to Use the NAG Library and its Documentation for further information.

NE_BAD_PARAM

On entry, argument $\langle \text{value} \rangle$ had an illegal value.

NE_INT

On entry, **incx** = $\langle \text{value} \rangle$.

Constraint: **incx** $\neq 0$.

On entry, **k** = $\langle \text{value} \rangle$.

Constraint: **k** ≥ 0 .

On entry, **n** = $\langle \text{value} \rangle$.

Constraint: **n** ≥ 0 .

NE_INT_2

On entry, **pdab** = $\langle \text{value} \rangle$, **k** = $\langle \text{value} \rangle$.

Constraint: **pdab** $\geq k + 1$.

NE_INTERNAL_ERROR

An unexpected error has been triggered by this function. Please contact NAG.

See Section 2.7.6 in How to Use the NAG Library and its Documentation for further information.

NE_NO_LICENCE

Your licence key may have expired or may not have been installed correctly.

See Section 2.7.5 in How to Use the NAG Library and its Documentation for further information.

7 Accuracy

The BLAS standard requires accurate implementations which avoid unnecessary over/underflow (see Section 2.7 of Basic Linear Algebra Subprograms Technical (BLAST) Forum (2001)).

8 Parallelism and Performance

`nag_ztbmv` (f16sgc) is not threaded in any implementation.

9 Further Comments

None.

10 Example

This example computes the matrix-vector product

$$y = \alpha Ax$$

where

$$A = \begin{pmatrix} 1.0 + 1.0i & 0.0 + 0.0i & 0.0 + 0.0i & 0.0 + 0.0i \\ 2.0 + 1.0i & 2.0 + 2.0i & 0.0 + 0.0i & 0.0 + 0.0i \\ 0.0 + 0.0i & 3.0 + 2.0i & 3.0 + 3.0i & 0.0 + 0.0i \\ 0.0 + 0.0i & 0.0 + 0.0i & 4.0 + 3.0i & 4.0 + 4.0i \end{pmatrix},$$

$$x = \begin{pmatrix} 1.0 + 1.0i \\ -2.0 + 2.0i \\ 3.0 - 2.0i \\ -1.0 + 1.0i \end{pmatrix}$$

and

$$\alpha = 1.0 + 0.0i.$$
