

## NAG Library Function Document

### **nag\_ztpsv (f16slc)**

## 1 Purpose

nag\_ztpsv (f16slc) solves a system of equations given as a complex triangular matrix stored in packed form.

## 2 Specification

```
#include <nag.h>
#include <nagf16.h>
void nag_ztpsv (Nag_OrderType order, Nag_UptoType uplo, Nag_TransType trans,
    Nag_DiagType diag, Integer n, Complex alpha, const Complex ap[],
    Complex x[], Integer incx, NagError *fail)
```

## 3 Description

nag\_ztpsv (f16slc) performs one of the matrix-vector operations

$$x \leftarrow \alpha A^{-1}x, \quad x \leftarrow \alpha A^{-T}x \quad \text{or} \quad x \leftarrow \alpha A^{-H}x,$$

where  $A$  is an  $n$  by  $n$  complex triangular matrix, stored in packed form,  $x$  is an  $n$ -element complex vector and  $\alpha$  is a complex scalar.  $A^{-T}$  denotes  $A^{-T}$  or equivalently  $A^{-T}$ ;  $A^{-H}$  denotes  $(A^H)^{-1}$  or equivalently  $(A^{-1})^H$ .

No test for singularity or near-singularity of  $A$  is included in this function. Such tests must be performed before calling this function.

## 5 Arguments

1: **order** – Nag\_OrderType *Input*

*On entry:* the **order** argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = Nag\_RowMajor. See Section 2.3.1.3 in How to Use the NAG Library and its Documentation for a more detailed explanation of the use of this argument.

*Constraint:* **order** = Nag\_RowMajor or Nag\_ColMajor.

2: **uplo** – Nag\_UptoType *Input*

*On entry:* specifies whether  $A$  is upper or lower triangular.

**uplo** = Nag\_Upper  
 $A$  is upper triangular.

**uplo** = Nag\_Lower  
 $A$  is lower triangular.

*Constraint:* **uplo** = Nag\_Upper or Nag\_Lower.

- 3:   **trans** – Nag\_TransType                              *Input*  
*On entry:* specifies the operation to be performed.  
**trans** = Nag\_NoTrans  
 $x \leftarrow \alpha A^{-1}x.$   
**trans** = Nag\_Trans  
 $x \leftarrow \alpha A^{-T}x.$   
**trans** = Nag\_ConjTrans  
 $x \leftarrow \alpha A^{-H}x.$   
*Constraint:* **trans** = Nag\_NoTrans, Nag\_Trans or Nag\_ConjTrans.
- 4:   **diag** – Nag\_DiagType                              *Input*  
*On entry:* specifies whether  $A$  has nonunit or unit diagonal elements.  
**diag** = Nag\_NonUnitDiag  
The diagonal elements are stored explicitly.  
**diag** = Nag\_UnitDiag  
The diagonal elements are assumed to be 1 and are not referenced.  
*Constraint:* **diag** = Nag\_NonUnitDiag or Nag\_UnitDiag.
- 5:   **n** – Integer                                      *Input*  
*On entry:*  $n$ , the order of the matrix  $A$ .  
*Constraint:* **n**  $\geq 0$ .
- 6:   **alpha** – Complex                                  *Input*  
*On entry:* the scalar  $\alpha$ .
- 7:   **ap**[*dim*] – const Complex                        *Input*  
**Note:** the dimension, *dim*, of the array **ap** must be at least  $\max(1, n \times (n + 1)/2)$ .  
*On entry:* the  $n$  by  $n$  triangular matrix  $A$ , packed by rows or columns.  
The storage of elements  $A_{ij}$  depends on the **order** and **uplo** arguments as follows:  
if **order** = Nag\_ColMajor and **uplo** = Nag\_Upper,  
 $A_{ij}$  is stored in **ap**[( $j - 1) \times j/2 + i - 1$ ], for  $i \leq j$ ;  
if **order** = Nag\_ColMajor and **uplo** = Nag\_Lower,  
 $A_{ij}$  is stored in **ap**[( $2n - j) \times (j - 1)/2 + i - 1$ ], for  $i \geq j$ ;  
if **order** = Nag\_RowMajor and **uplo** = Nag\_Upper,  
 $A_{ij}$  is stored in **ap**[( $2n - i) \times (i - 1)/2 + j - 1$ ], for  $i \leq j$ ;  
if **order** = Nag\_RowMajor and **uplo** = Nag\_Lower,  
 $A_{ij}$  is stored in **ap**[( $i - 1) \times i/2 + j - 1$ ], for  $i \geq j$ .  
If **diag** = Nag\_UnitDiag, the diagonal elements of AP are assumed to be 1, and are not referenced; the same storage scheme is used whether **diag** = Nag\_NonUnitDiag or **diag** = Nag\_UnitDiag.
- 8:   **x**[*dim*] – Complex                            *Input/Output*  
**Note:** the dimension, *dim*, of the array **x** must be at least  $\max(1, 1 + (\mathbf{n} - 1)|\mathbf{inex}|)$ .  
*On entry:* the vector  $x$ .  
*On exit:* the solution vector  $x$ .

9: <b>incx</b> – Integer	<i>Input</i>
<i>On entry:</i> the increment in the subscripts of <b>x</b> between successive elements of <i>x</i> .	
Constraint: <b>incx</b> ≠ 0.	
10: <b>fail</b> – NagError *	
<i>Input/Output</i>	
The NAG error argument (see Section 2.7 in How to Use the NAG Library and its Documentation).	

## 6 Error Indicators and Warnings

### NE\_ALLOC\_FAIL

Dynamic memory allocation failed.

See Section 2.3.1.2 in How to Use the NAG Library and its Documentation for further information.

### NE\_BAD\_PARAM

On entry, argument  $\langle value \rangle$  had an illegal value.

### NE\_INT

On entry, **incx** =  $\langle value \rangle$ .

Constraint: **incx** ≠ 0.

On entry, **n** =  $\langle value \rangle$ .

Constraint: **n** ≥ 0.

### NE\_INTERNAL\_ERROR

An unexpected error has been triggered by this function. Please contact NAG.

See Section 2.7.6 in How to Use the NAG Library and its Documentation for further information.

### NE\_NO\_LICENCE

Your licence key may have expired or may not have been installed correctly.

See Section 2.7.5 in How to Use the NAG Library and its Documentation for further information.

## 7 Accuracy

The BLAS standard requires accurate implementations which avoid unnecessary over/underflow (see Section 2.7 of Basic Linear Algebra Subprograms Technical (BLAST) Forum (2001)).

## 8 Parallelism and Performance

`nag_ztpsv` (f16slc) is not threaded in any implementation.

## 9 Further Comments

None.

## 10 Example

Solves complex triangular system of linear equations,  $Ax = y$ , where  $A$  is a complex triangular 4 by 4 matrix, stored in packed storage format, given by

$$A = \begin{pmatrix} 4.78 + 4.56i & & & \\ 2.00 - 0.30i & -4.11 + 1.25i & & \\ 2.89 - 1.34i & 2.36 - 4.25i & 4.15 + 0.80i & \\ -1.89 + 1.15i & 0.04 - 3.69i & -0.02 + 0.46i & 0.33 - 0.26i \end{pmatrix},$$

and

$$y = \begin{pmatrix} -14.78 - 32.36i \\ 2.98 - 2.14i \\ -20.96 + 17.06i \\ 9.54 + 9.91i \end{pmatrix}.$$
