## nag\_mv\_procustes (g03bcc)

### 1 Purpose

nag\_mv\_procustes (g03bcc) computes Procrustes rotations in which an orthogonal rotation is found so that a transformed matrix best matches a target matrix.

### 2 Specification

```
#include <nag.h>
#include <nagg03.h>

void nag_mv_procustes (Nag_TransNorm stand, Nag_RotationScale pscale,
    Integer n, Integer m, double x[], Integer tdx, double y[], Integer tdy,
    double yhat[], double r[], Integer tdr, double *alpha, double *rss,
    double res[], NagError *fail)
```

### 3 Description

Let  $X$  and  $Y$  be  $n$  by  $m$  matrices. They can be considered as representing sets of  $n$  points in an  $m$ -dimensional space. The  $X$  matrix may be a matrix of loadings from say factor or canonical variate analysis, and the  $Y$  matrix may be a postulated pattern matrix or the loadings from a different sample. The problem is to relate the two sets of points without disturbing the relationships between the points in each set. This can be achieved by translating, rotating and scaling the sets of points. The  $Y$  matrix is considered as the target matrix and the  $X$  matrix is rotated to match that matrix.

First the two sets of points are translated so that their centroids are at the origin to give  $X_c$  and  $Y_c$ , i.e., the matrices will have zero column means. Then the rotation of the translated  $X_c$  matrix which minimizes the sum of squared distances between corresponding points in the two sets is found. This is computed from the singular value decomposition of the matrix:

$$X_c^T Y_c = U D V^T,$$

where  $U$  and  $V$  are orthogonal matrices and  $D$  is a diagonal matrix. The matrix of rotations,  $R$ , is computed as:

$$R = UV^T.$$

After rotation, a scaling or dilation factor,  $\alpha$ , may be estimated by least squares. Thus, the final set of points that best match  $Y_c$  is given by:

$$\hat{Y}_c = \alpha X_c R.$$

Before rotation, both sets of points may be normalized to have unit sums of squares or the  $X$  matrix may be normalized to have the same sum of squares as the  $Y$  matrix. After rotation, the results may be translated to the original  $Y$  centroid.

The  $i$ th residual,  $r_i$ , is given by the distance between the point given in the  $i$ th row of  $Y$  and the point given in the  $i$ th row of  $\hat{Y}$ . The residual sum of squares is also computed.

## 5 Arguments

- 1: **stand** – Nag\_TransNorm *Input*  
*On entry:* indicates if translation/normalization is required.  
**stand** = Nag\_NoTransNorm  
 No translation or normalization.  
**stand** = Nag\_Orig  
 Translation to the origin.  
**stand** = Nag\_OrigCentroid  
 Translation to the origin and then to the  $Y$  centroid after rotation.  
**stand** = Nag\_Norm  
 Unit normalization.  
**stand** = Nag\_OrigNorm  
 Translation and normalization.  
**stand** = Nag\_OrigNormCentroid  
 Translation and normalization to  $Y$  scale, then translation to the  $Y$  centroid after rotation.  
*Constraint:* **stand** = Nag\_NoTransNorm, Nag\_Orig, Nag\_OrigCentroid, Nag\_Norm, Nag\_OrigNorm or Nag\_OrigNormCentroid.
- 2: **pscale** – Nag\_RotationScale *Input*  
*On entry:* indicates if least squares scaling is applied after rotation.  
**pscale** = Nag\_LsqScale  
 Scaling is to be applied.  
**pscale** = Nag\_NotLsqScale  
 No scaling is applied.  
*Constraint:* **pscale** = Nag\_LsqScale or Nag\_NotLsqScale.
- 3: **n** – Integer *Input*  
*On entry:* the number of points,  $n$ .  
*Constraint:*  $n \geq 1$ .
- 4: **m** – Integer *Input*  
*On entry:* the number of dimensions,  $m$ .  
*Constraints:*  

$$\mathbf{m} \geq 1;$$

$$\mathbf{m} \leq \mathbf{n}.$$
- 5: **x[n × tdx]** – double *Input/Output*  
**Note:** the  $(i, j)$ th element of the matrix  $X$  is stored in  $\mathbf{x}[(i - 1) \times \mathbf{tdx} + j - 1]$ .  
*On entry:* the matrix to be rotated,  $X$ .  
*On exit:* if **stand** = Nag\_NoTransNorm,  $\mathbf{x}$  will be unchanged.  
 If **stand** = Nag\_Orig, Nag\_OrigCentroid, Nag\_OrigNorm or Nag\_OrigNormCentroid,  $\mathbf{x}$  will be translated to have zero column means.  
 If **stand** = Nag\_Norm or Nag\_OrigNorm,  $\mathbf{x}$  will be scaled to have unit sum of squares.  
 If **stand** = Nag\_OrigNormCentroid,  $\mathbf{x}$  will be scaled to have the same sum of squares as  $\mathbf{y}$ .

- 6: **tdx** – Integer *Input*  
*On entry:* the stride separating matrix column elements in the array **x**.  
*Constraint:* **tdx**  $\geq$  **m**.
- 7: **y[n × tdy]** – double *Input/Output*  
**Note:** the  $(i, j)$ th element of the matrix  $Y$  is stored in **y**[( $i - 1$ ) × **tdy** +  $j - 1$ ].  
*On entry:* the target matrix,  $Y$ .  
*On exit:* if **stand** = Nag\_NoTransNorm, then **y** will be unchanged.  
 If **stand** = Nag\_Orig or Nag\_OrigNorm, then **y** will be translated to have zero column means.  
 If **stand** = Nag\_Norm or Nag\_OrigNorm, then **y** will be scaled to have unit sum of squares.  
 If **stand** = Nag\_OrigCentroid or Nag\_OrigNormCentroid, then **y** will be translated and then after rotation, translated back. The output **y** should be the same as the input **y** except for rounding errors.
- 8: **tdy** – Integer *Input*  
*On entry:* the stride separating matrix column elements in the arrays **y**, **yhat**.  
*Constraint:* **tdy**  $\geq$  **m**.
- 9: **yhat[n × tdy]** – double *Output*  
**Note:** the  $(i, j)$ th element of the matrix is stored in **yhat**[( $i - 1$ ) × **tdy** +  $j - 1$ ].  
*On exit:* the fitted matrix,  $\hat{Y}$ .
- 10: **r[m × tdr]** – double *Output*  
**Note:** the  $(i, j)$ th element of the matrix  $R$  is stored in **r**[( $i - 1$ ) × **tdr** +  $j - 1$ ].  
*On exit:* the matrix of rotations,  $R$ , see Section 9.
- 11: **tdr** – Integer *Input*  
*On entry:* the stride separating matrix column elements in the array **r**.  
*Constraint:* **tdr**  $\geq$  **m**.
- 12: **alpha** – double \* *Output*  
*On exit:* if **pscale** = Nag\_LsqScale the scaling factor,  $\alpha$ ; otherwise **alpha** is not set.
- 13: **rss** – double \* *Output*  
*On exit:* the residual sum of squares.
- 14: **res[n]** – double *Output*  
*On exit:* the residuals,  $r_i$ , for  $i = 1, 2, \dots, n$ .
- 15: **fail** – NagError \* *Input/Output*  
 The NAG error argument (see Section 2.7 in How to Use the NAG Library and its Documentation).

## 6 Error Indicators and Warnings

### NE\_2\_INT\_ARG\_GT

On entry,  $\mathbf{m} = \langle value \rangle$  while  $\mathbf{n} = \langle value \rangle$ . These arguments must satisfy  $\mathbf{m} \leq \mathbf{n}$ .

### NE\_2\_INT\_ARG\_LT

On entry,  $\mathbf{tdr} = \langle value \rangle$  while  $\mathbf{m} = \langle value \rangle$ . These arguments must satisfy  $\mathbf{tdr} \geq \mathbf{m}$ .

On entry,  $\mathbf{tdx} = \langle value \rangle$  while  $\mathbf{m} = \langle value \rangle$ . These arguments must satisfy  $\mathbf{tdx} \geq \mathbf{m}$ .

On entry,  $\mathbf{tdy} = \langle value \rangle$  while  $\mathbf{m} = \langle value \rangle$ . These arguments must satisfy  $\mathbf{tdy} \geq \mathbf{m}$ .

### NE\_ALLOC\_FAIL

Dynamic memory allocation failed.

### NE\_BAD\_PARAM

On entry, argument **pscale** had an illegal value.

On entry, argument **stand** had an illegal value.

### NE\_INT\_ARG\_LT

On entry,  $\mathbf{m} = \langle value \rangle$ .

Constraint:  $\mathbf{m} \geq 1$ .

On entry,  $\mathbf{n} = \langle value \rangle$ .

Constraint:  $\mathbf{n} \geq 1$ .

### NE\_INTERNAL\_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

### NE\_LSQ\_SCAL\_ZERO\_PTS

The fitted matrix  $\hat{Y}$ , contains only zero-points when least squares scaling is applied.

### NE\_NORM\_ZERO\_PTS

On entry, either  $\mathbf{x}$  or  $\mathbf{y}$  contains only zero-points (possibly after translation) when normalization is to be applied.

### NE\_SVD\_NOT\_CONV

The singular value decomposition has failed to converge. This is an unlikely error exit.

## 7 Accuracy

The accuracy of the calculation of the rotation matrix largely depends upon the singular value decomposition. See the f08 Chapter Introduction for further details.

## 8 Parallelism and Performance

nag\_mv\_procustes (g03bcc) is not threaded in any implementation.

## 9 Further Comments

Note that if the matrix  $X_c^T Y$  is not of full rank, then the matrix of rotations,  $R$ , may not be unique even if there is a unique solution in terms of the rotated matrix,  $\hat{Y}_c$ . The matrix  $R$  may also include reflections as well as pure rotations, see Krzanowski (1990).

If the column dimensions of the  $X$  and  $Y$  matrices are not equal, the smaller of the two should be supplemented by columns of zeros. Adding a column of zeros to both  $X$  and  $Y$  will have the effect of allowing reflections as well as rotations.

## 10 Example

Three points representing the vertices of a triangle in two dimensions are input. The points are translated and rotated to match the triangle given by (0,0),(1,0),(0,2) and scaling is applied after rotation. The target matrix and fitted matrix are printed along with additional information.
