

NAG Library Function Document

nag_rand_exp_mix (g05sgc)

1 Purpose

nag_rand_exp_mix (g05sgc) generates a vector of pseudorandom numbers from an exponential mix distribution composed of m exponential distributions each having a mean a_i and weight w_i .

2 Specification

```
#include <nag.h>
#include <nagg05.h>

void nag_rand_exp_mix (Integer n, Integer nmix, const double a[],
    const double wgt[], Integer state[], double x[], NagError *fail)
```

3 Description

The distribution has PDF (probability density function)

$$f(x) = \sum_{i=1}^m \frac{1}{a_i} w_i e^{-x/a_i} \quad \text{if } x \geq 0,$$

$$f(x) = 0 \quad \text{otherwise,}$$

where $\sum_{i=1}^m w_i = 1$ and $a_i > 0$, $w_i \geq 0$.

nag_rand_exp_mix (g05sgc) returns the values x_i by selecting, with probability w_j , random variates from an exponential distribution with argument a_j .

One of the initialization functions nag_rand_init_repeatable (g05kfc) (for a repeatable sequence if computed sequentially) or nag_rand_init_nonrepeatable (g05kge) (for a non-repeatable sequence) must be called prior to the first call to nag_rand_exp_mix (g05sgc).

5 Arguments

- 1: **n** – Integer *Input*
On entry: n , the number of pseudorandom numbers to be generated.
Constraint: $n \geq 0$.
- 2: **nmix** – Integer *Input*
On entry: m , the number of exponential distributions in the mix.
Constraint: $\text{nmix} \geq 1$.
- 3: **a[nmix]** – const double *Input*
On entry: the m parameters a_i for the m exponential distributions in the mix.
Constraint: $\mathbf{a}[i-1] > 0.0$, for $i = 1, 2, \dots, \text{nmix}$.

- 4: **wgt**[**nmix**] – const double *Input*
On entry: the m weights w_i for the m exponential distributions in the mix.
Constraints:
- $$\sum_{i=1}^m \mathbf{wgt}[i-1] = 1.0;$$
- $$\mathbf{wgt}[i-1] \geq 0.0, \text{ for } i = 1, 2, \dots, m.$$
- 5: **state**[*dim*] – Integer *Communication Array*
Note: the dimension, *dim*, of this array is dictated by the requirements of associated functions that must have been previously called. This array **MUST** be the same array passed as argument **state** in the previous call to nag_rand_init_repeatable (g05kfc) or nag_rand_init_nonrepeatable (g05kge).
On entry: contains information on the selected base generator and its current state.
On exit: contains updated information on the state of the generator.
- 6: **x**[**n**] – double *Output*
On exit: the n pseudorandom numbers from the specified exponential mix distribution.
- 7: **fail** – NagError * *Input/Output*
 The NAG error argument (see Section 2.7 in How to Use the NAG Library and its Documentation).

6 Error Indicators and Warnings

NE_ALLOC_FAIL

Dynamic memory allocation failed.

See Section 2.3.1.2 in How to Use the NAG Library and its Documentation for further information.

NE_BAD_PARAM

On entry, argument $\langle value \rangle$ had an illegal value.

NE_INT

On entry, **n** = $\langle value \rangle$.

Constraint: **n** ≥ 0 .

On entry, **nmix** = $\langle value \rangle$.

Constraint: **nmix** ≥ 1 .

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.

See Section 2.7.6 in How to Use the NAG Library and its Documentation for further information.

NE_INVALID_STATE

On entry, **state** vector has been corrupted or not initialized.

NE_NO_LICENCE

Your licence key may have expired or may not have been installed correctly.
See Section 2.7.5 in How to Use the NAG Library and its Documentation for further information.

NE_REAL_ARRAY

On entry, $\mathbf{a}[\langle value \rangle] = \langle value \rangle$.
Constraint: $\mathbf{a}[i - 1] > 0.0$.

On entry, sum of $\mathbf{wgt} = \langle value \rangle$.
Constraint: sum of $\mathbf{wgt} = 1.0$.

On entry, $\mathbf{wgt}[\langle value \rangle] = \langle value \rangle$.
Constraint: $\mathbf{wgt}[i - 1] \geq 0.0$.

7 Accuracy

Not applicable.

8 Parallelism and Performance

nag_rand_exp_mix (g05sgc) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

Please consult the x06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

9 Further Comments

None.

10 Example

This example prints the first five pseudorandom numbers from an exponential mix distribution comprising three exponential distributions with parameters $a_1 = 1.0$, $a_2 = 5.0$ and $a_3 = 2.0$, and with respective weights 0.5, 0.3 and 0.2. The numbers are generated by a single call to nag_rand_exp_mix (g05sgc), after initialization by nag_rand_init_repeatabl (g05kfc).
