

NAG Library Function Document

nag_robust_trimmed_1var (g07ddc)

1 Purpose

nag_robust_trimmed_1var (g07ddc) calculates the trimmed and Winsorized means of a sample and estimates of the variances of the two means.

2 Specification

```
#include <nag.h>
#include <nagg07.h>

void nag_robust_trimmed_1var (Integer n, const double x[], double alpha,
    double *tmean, double *wmean, double *tvar, double *wvar, Integer *k,
    double sx[], NagError *fail)
```

3 Description

nag_robust_trimmed_1var (g07ddc) calculates the α -trimmed mean and α -Winsorized mean for a given α , as described below.

Let x_i , for $i = 1, 2, \dots, n$, represent the n sample observations sorted into ascending order. Let $k = [\alpha n]$ where $[y]$ represents the integer nearest to y ; if $2k = n$ then k is reduced by 1.

Then the trimmed mean is defined as:

$$\bar{x}_t = \frac{1}{n - 2k} \sum_{i=k+1}^{n-k} x_i,$$

and the Winsorized mean is defined as:

$$\bar{x}_w = \frac{1}{n} \sum_{i=k+1}^{n-k} x_i + (kx_{k+1}) + (kx_{n-k}).$$

nag_robust_trimmed_1var (g07ddc) then calculates the Winsorized variance about the trimmed and Winsorized means respectively and divides by n to obtain estimates of the variances of the above two means.

Thus we have

$$\text{Estimate of } \text{var}(\bar{x}_t) = \frac{1}{n^2} \sum_{i=k+1}^{n-k} (x_i - \bar{x}_t)^2 + k(x_{k+1} - \bar{x}_t)^2 + k(x_{n-k} - \bar{x}_t)^2$$

and

$$\text{Estimate of } \text{var}(\bar{x}_w) = \frac{1}{n^2} \sum_{i=k+1}^{n-k} (x_i - \bar{x}_w)^2 + k(x_{k+1} - \bar{x}_w)^2 + k(x_{n-k} - \bar{x}_w)^2.$$

5 Arguments

- | | | |
|-----|--|---------------------|
| 1: | n – Integer | <i>Input</i> |
| | <i>On entry:</i> the number of observations, n . | |
| | <i>Constraint:</i> $n \geq 2$. | |
| 2: | x[n] – const double | <i>Input</i> |
| | <i>On entry:</i> the sample observations, x_i , for $i = 1, 2, \dots, n$. | |
| 3: | alpha – double | <i>Input</i> |
| | <i>On entry:</i> the proportion of observations to be trimmed at each end of the sorted sample, α . | |
| | <i>Constraint:</i> $0.0 \leq \mathbf{alpha} < 0.5$. | |
| 4: | tmean – double * | <i>Output</i> |
| | <i>On exit:</i> the α -trimmed mean, \bar{x}_t . | |
| 5: | wmean – double * | <i>Output</i> |
| | <i>On exit:</i> the α -Winsorized mean, \bar{x}_w . | |
| 6: | tvar – double * | <i>Output</i> |
| | <i>On exit:</i> contains an estimate of the variance of the trimmed mean. | |
| 7: | wvar – double * | <i>Output</i> |
| | <i>On exit:</i> contains an estimate of the variance of the Winsorized mean. | |
| 8: | k – Integer * | <i>Output</i> |
| | <i>On exit:</i> contains the number of observations trimmed at each end, k . | |
| 9: | sx[n] – double | <i>Output</i> |
| | <i>On exit:</i> contains the sample observations sorted into ascending order. | |
| 10: | fail – NagError * | <i>Input/Output</i> |
| | The NAG error argument (see Section 2.7 in How to Use the NAG Library and its Documentation). | |

6 Error Indicators and Warnings

NE_INT_ARG_LT

On entry, **n** = $\langle value \rangle$.
 Constraint: $n \geq 2$.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

NE_REAL_ARG_GE

On entry, **alpha** must not be greater than or equal to 0.5: **alpha** = $\langle value \rangle$.

NE_REAL_ARG_LT

On entry, **alpha** must not be less than 0.0: **alpha** = $\langle value \rangle$.

7 Accuracy

The results should be accurate to within a small multiple of *machine precision*.

8 Parallelism and Performance

nag_robust_trimmed_lvar (g07ddc) is not threaded in any implementation.

9 Further Comments

The time taken by nag_robust_trimmed_lvar (g07ddc) is proportional to n .

10 Example

The following program finds the α -trimmed mean and α -Winsorized mean for a sample of 16 observations where $\alpha = 0.15$. The estimates of the variances of the above two means are also calculated.
